

## Childhood Vaccine Injury - 5 year old Holly Stavola

**Holly, a daughter and a sister, was 5 years old when she died. It was sudden and tragic, it was right after her 5th birthday and wellness check up with her pediatrician.**

She was completely healthy, beautiful, smart, kind and a child who was very close to Jesus.

It was only through strong faith and the work in Holly's memory that we were able to survive after her passing. We have always been committed Christians so we would like to share our love of the faith with all of you.

**We Will Never Forget Holly Stavola At just five years old, Holly died from her kindergarten "booster" vaccine.**

Wise words from her mother Robin Stavola: "We post this in Holly's memory in hopes that others could hear the truth, as we did not have that opportunity.

**"I didn't feel a need to research the subject of vaccines because I trusted that my pediatrician not only possessed sufficient vaccine knowledge but also had my children's best interest at heart.**

I was both unaware of vaccine risks and was never informed, so without hesitation, I followed my pediatrician's advice. Here I am, years later, and the atmosphere surrounding the vaccine issue has significantly changed – and not for the better. "Fully informed consent is still not present in most doctors' offices, the freedom to take an exemption is being threatened or has already been eliminated in some states, the integrity of our governmental institutions – and even the integrity of our pediatricians – is in question. Parents are being bullied, scolded and dismissed from the office. Not all pediatricians, but the ones who have taken it upon themselves to kick out their child patients for a difference of opinion, should be held accountable by the AAP and AMA, but instead, these organizations seem to support this unfair and disgraceful tactic. "Trust and fear are what maintains the illusion of vaccine necessity. "Vaccines are a medical procedure that carries risk, they are not a one-size-fits-all panacea, they do not create a community immunity. And this isn't just because the adults are not up-to-date, it's because vaccines are ineffective in terms of producing immunity for any period of time (vaccines only address one small component of immunity: antibodies) and therefore the procedure cannot adequately simulate the natural human immune system. Do your research and don't expect to hear the truth from those who you may think have your back." Full story at <http://hopefromholly.com>
