Hi Dr. Makis,

I write to you to learn whether you believe Ivermectin might help my wife.

Last October she struggled to walk. Felt stiff in the joints, both hands and knees. She struggled to lift herself out of bed. As a result she was admitted to hospital where a professor said she had **Rheumatoid Arthritis**. He prescribed her with medication which she took and had an adverse reaction. He then prescribed new medication. At that time we saw our family doctor who thought she had a muscular condition. He prescribed medication and we decided to leave the professor. My wife then experienced increased inflammation levels. From there she experienced chest pains and a decrease in iron levels. Then 4 weeks ago they discovered pericarditis and soon after two blood clots one in the leg and one in the chest.

Thanks Dr Makis,

When I asked the doctors and specialists what has been the contributing factor all of them shrugged their shoulders.

When I said **how about the 2 Pfizer jabs she had, they were immediately dismissive.**

I appreciate your advice and prompt follow up.

Warmest regards

She could do a trial of Ivermectin, I would suggest 0.5mg/kg/day for several weeks and see how she feels

William

Hello Dr Makis,

My wife continued with the medication prescribed by doctors plus she took ivermectin as you [REDACTED] Her inflammation, iron, pericarditis all back to normal, the blood clots gone, her appetite has returned and she can now walk for 50mins around the block daily :)

Thank you for your advice. I am extremely grateful and may God bless you and your family.

Dr Makis, if I may, I have one further requirement. My dear [REDACTED] was diagnosed with cancer a couple of years ago. We've been through a lot, and I'm reaching out in desperation and hope that you could read the attached information and provide your kind advice on the type of medication and dosage she might need. Her chemotherapy was unfortunately ineffective, and now she's undergoing radiotherapy. Your expertise and support in this difficult time would mean the world to us. I am incredibly grateful for the help you provide to those in need. Here in Australia, the medical landscape is increasingly influenced by politics, making your guidance even more invaluable.

Warm Regards
[REDACTED]

Hi Dr Makis,

I thank you for your prompt response and advice regarding my [REDACTED]

My wife began taking Ivermectin daily from second week September, and she stopped second week of November - about 2 month's.

Warm regards
[REDACTED]

My Take...

I haven't been able to help as many COVID-19 Vaccine injured people as I had hoped, as I've been so overwhelmed with Cancer requests.

But I've written articles about Ivermectin and inflammatory conditions such as Rheumatoid Arthritis, or Lyme Disease.

Although Ivermectin dosing isn't established in inflammatory conditions, if faced with an inflammatory condition myself, I would take 0.5mg/kg/day for 3-4 weeks

This is at the upper limit of established dosing for anti-viral and anti-parasitic indications, with minimal risk of side effects.

In this case, patient took 0.5mg/kg/day for 2 months and the following happened

“Her inflammation, iron, pericarditis all back to normal, the blood clots gone, her appetite returned and she can now walk for 50 mins around the block daily”

Simple, wasn't it?

Why couldn't her doctors do this?

Because of the illegal interference of medical boards in the patient-doctor relationship, doctors are too afraid to help their patients in this manner.

This holds for Australian, Canadian, UK, Irish, and even some US medical boards

Not only should medical boards be dissolved but the leaders of these medical boards should receive very long prison sentences.

The harm they've done over the past 4 years, is incalculable.
