STORY:

- 40s year old Stage 4 Lung Cancer Patient in the UK
- In August 2024, we started Ivermectin 1mg/kg/day
- and Fenbendazole 444mg/day 6 days on 1 day off

There were some transient visual effects from Ivermectin to overcome in the first few weeks:

But they went away after a few days! And less need for pain medications!

Hi William,

So figured good to start back from all the ivermectin and fenbendazole as day 1 dosage tomorrow again and go a bit slower up? What do you think? How do other people manage?

Maybe it is because of the other prescription or pain meds I am taking? Which by the way, I haven't needed to use any of the Oro-morphine liquid for over a week and have stopped taking paracetamol since Tuesday also as not needed - this should be seen as good news right? 😊

Thanks again and I really look forward to hearing from you.

[REDACTED]

P.S. All side effects have completely gone now.

- "All side effects have completely gone now"
- Patient no longer needed strong pain medication:

Dear William,

I wanted to share some good news with you after receiving my 1st scan results back from the oncology team (after 3 rounds of 28 days of Tagrisso tabs).

They are good! The cancer is stable and all lesions / tumours have shrunk. The biggest shrink of all was the one above adrenal gland which has gone from (oncologist here couldn't say exactly but thinks around just over) 6 - 3.6cm! The spots on the left lung and liver were "so small they were too small to measure, maybe a mm or so."

I am happy to continue to take my alternative treatment of course :)

Kind regards,
[REDACTED]

My Take...

It is wonderful to see results like this after only 3 months!

Sometimes there are some minor growing pains in the beginning - some transient side effects to overcome (like the visual effects for ivermectin), but once you overcome them, it's smooth sailing!

In this case they lasted about 10 days and then they were gone.

And yes, we did push to get to Ivermectin 2mg/kg/day and Fenbendazole 888mg/day.

Can you imagine a Stage 4 Lung 6cm adrenal metastasis shrinking to 3.6cm and all other lesions shrinking, some disappearing or becoming too small to measure?

Not bad for horse medicine!

UK patients have it hard as it's quite difficult to obtain Ivermectin and Fenbendazole but many try and succeed despite the roadblocks!
