Hi and thank you, Dr. Makis for giving us, and all people around the world, HOPE, HOPE for Health. We're excited ALL THE MORE for the possibility that ROBERT F KENNEDY JR. might ask you to join his team here in the USA. Praying that this may happen, and that you and your team might be able to relocate to the USA, at least for a time, until you help right the World back on its axis.

My wife just had a Rectosigmoid, low anterior resection on 02-10-2025, after it being discovered during a routine colonoscopy screening on 01-09-2025. [redacted] is 64 years old, and otherwise healthy. After learning of the mass on1/9/25, she immediately joined me in eating a ketogenic diet, with less than 25g of carbs/day. She does not want to do chemo, which we've been told is the standard of care, as she had 2 of 29 lymph nodes being positive for metastatic carcinoma, measuring 4 mm in greatest dimension.

We've watched several of your interviews, reviewed your website, substack, and read the TARGETING THE MITOCHONDRIAL-STEM CELL CONNECTION IN CANCER TREATMENT: A HYBRID ORTHOMOLECULAR PROTOCOL in the Journal of Orthomolecular Medicine, which you provided, and are **wanting to use your protocols.**

How do we get started?

Most sincerely, and hopeful,

[redacted]

PROTOCOL:

A 64 year old patient with Stage 3B Colon Cancer had surgery in January 2025 which found involvement of two lymph nodes.

After surgery she was found to have a suspicious lung nodule on CT.

We started:

Ivermectin 1.0mg/kg/day

Mebendazole 1000mg/day

RESULTS:

Good afternoon, Dr. Makis.

I have been on your protocol for my colon cancer ([redacted]) since February 27, 2025. the only component I have had to eliminate is [redacted]. I wanted to share the great news that this morning I received my second Signatera test results and they were NEGATIVE!

Also, yesterday, I had a PET scan as an initial CT scan (the day after my colonoscopy on 1/9/25 which discovered my tumor) showed a 1 cm nodule on my lower right lung lobe. It was hoped that this nodule was due to a bout with Covid I had back in 2021, but it couldn't be ruled out without further examination.

The PET scan results came today informing me that there is "No evidence of hypermetabolic recurrent or metastatic disease." It mentioned the 1.0 cm right lower lobe pulmonary nodule, without FDG uptake.

So...today has been a very good day, indeed!

Thank you for the role you've played in my journey to become cancer-free.

Most sincerely,

[redacted]

Good afternoon, Dr. Makis.

I have my third Signatera blood draw and follow up visit with my local oncologist next Tuesday, May 20th. In review, I started your alternative protocol for Stage 3b colon cancer on February 28, slowly introducing Ivermectin and Mebendazole before adding the recommended additional supplements and vitamins. Both Signatera tests to date have been negative and a PET scan performed on April 14 indicated "no evidence of hypermetabolic recurrent or metastatic disease."

I should receive the 3rd Signatera results within a week of May 20th. If the results are negative (with a reliability of 96%), would you advise I discontinue the protocol at that time? If so, are there any components of the protocol (specifically vitamins or supplements) that you would advise I continue on, or perhaps continue at a lower daily dosage?

Thank you in advance for your attention and response to my questions. I cannot begin to adequately express my heartfelt gratitude for your expertise and dedication in helping successfully fight cancer for patients such as me. Truly, you have made a life-altering impact, in the best of ways, for me and my family.

I am most appreciatively yours,

[redacted]

Dr. Makis,

I had my appointment with my oncologist today. After reviewing my second Signatera test and my PET scan results, he pronounced me CANCER-FREE! Even though he had recommended chemo, he was aware that I had chosen an alternative protocol using repurposed drugs...and he supported me in my decision.

And so - I would appreciate your input - is there any part of the protocol you created for me that I need to continue? Any recommended vitamins or supplements?

Most appreciatively,

[redacted]

Thank you, [redacted]! I am truly overwhelmed and so very grateful for today's pronouncement by my oncologist. Thank you for celebrating with me.

Most sincerely,

[redacted]

My Take...

A 64 year old patient with Stage 3B Colon Cancer had surgery in January 2025, was found to have 2 positive lymph nodes for cancer and post op CT revealed a 1cm suspicious lung nodule

She didn't want chemo, and after less than 3 months on Ivermectin and Mebendazole she was declared CANCER FREE.

SIGNATERA is a new blood test that can identify molecular residual disease (MRD), or recurrent cancer, sooner than existing methods by detecting the presence of circulating tumor DNA (ctDNA).

In this case, because the patient came to me after surgery, we only had to contend with microscopic residual disease, maybe additional lymph node involvement and a suspicious lung nodule.

It was such a joy to see the patient declared "Cancer Free" after only 3 months!
