## Mother of 4 Emily Ziegler Faced Pancreatic Cancer at Age 36

Contributing Writer

Julia Brabant

November 18, 2024

**Diagnosed:** August 2022

**Current Status:** No Evidence of Disease

Diagnosed with pancreatic cancer at just 36, St. Louis, Missouri resident and mother of four Emily Ziegler faced an uphill battle after an intensive Whipple surgery failed to remove her cancer in its entirety. Now, after switching oncology teams and trying a series of alternative treatments, she's currently showing no evidence of disease and emerging with a fresh perspective about life and how she wants to spend it.

Emily had just celebrated her 36<sup>th</sup> birthday when intense abdominal pain sidelined her, leading to a stint in the hospital for severe pancreatitis. Tests showed that she had elevated lipase levels, which can potentially indicate cancer, pancreatic issues and other serious health conditions. While a lipase level of 100 is typical, Emily's had reached 10,000.

Where can I add my ivermectin testimonial? It helped me beat pancreatic cancer!

@FranDHexe

I had pancreatic cancer. When I was having a recurrence, I was denied treatment. My doctor went as far as withholding one of my scans to delay me going elsewhere. I could've died in the 3 months it took to get that scan and new care team set up. We'll my mother in law heard Dr. Makis talk about this. She told me to take it. So I did. For 3 months the tumor saw ZERO changes. Then new care team delivered only 6 weeks of chemo/radiation and my scans shortly after showed that the tumor was completely gone!

@FranDHexe

I used a paste protocol since I didn't have access to the pills at the time. And my mother in law only knew of Dr. Makis and his research, not how to reach him for more information.

## MORE DETAILED STORY:

**Mama's Mead & Menageries** ✓

@FranDHexe

I was for work. 6 months later, I was hospitalized with severe acute pancreatitis. Doctors thought it was a fluke given my age and health and given the fact that I bounced back immediately. But then it happened again 6 months later. Then they said I should see a GI doc. But being a 36 yr old mom of 4 in school and working, I didn't see the urgency until the pain was back and unrelenting a few months later. I saw a GI doc and showed up extremely itchy and extremely yellow. It made no sense, but he went with his gut and did a biopsy. Turns out, I had stage 2b PDAC. The bad kind. While caught early, it was wrapped around my blood vessels, preventing me from getting the whipple. I did 6 months of chemo, which thankfully shrunk the tumor away from the blood vessels, yet by the time I had my whipple, the tumor that removed was nearly twice the size since diagnosis. The chemo, Folforinox, couldn't keep up with the tumors growth. After a horrible nightmare with my whipple, I was told two things. 1. They ran a full genetic panel, assuming it was genetic given my age and health. Nothing. It's NOT genetic. 2. My scans are clear. They got it all!

But they didn't. Instead of getting better, i was actually declining. I kept bringing up my issues with my doctor, especially concerning symptoms associated with this cancer, the pale colored floating stools. She insisted it was "all in my head," and my symptoms were caused by depression. She prescribed me a sleeping pill and sent me to therapy.

But then my CA-19 tumor spiked. They didn't seem worried. I had a CT scan. I read my report on MyChart. I had a new fricking tumor damn near the same size as the first. In just 8 months. They called days later. Unconcerned and in no rush to schedule my follow-up PET scan. Or now a mammogram? I need a mammogram now bc all these scans for pancan has picked up a new spot that keeps getting bigger!?!?! But they refused to schedule that. Drug their heels on scheduling the PET scan.

I arranged to travel out of town to MD Anderson. I requested my records be sent weeks prior to my departure. I brought my PET scan with me due to timing. Everything was sent, but that recent CT scan. A week before we leave, they still haven't. We leave and get there. They still haven't sent it. We've been on the phone with them and continued the entire time were out of town for the appt. Asking why they haven't sent it? They've had weeks now. And they know their tumor boards meets! They can't plot out treatment without it! And they were concerned. Bc tucked away in my medical records was a note about my post op pathology report showing a positive margin. That they completely ignored. And according to the PET, my recurrence lines up with it.

At this point, my oncologist is made aware and wish to be treated STAT! She flat out refused. I was offered to go to THEIR clinical trials. I asked for a new doctor. A patient "advocate" called me and told me that all doctors refuse to accept me as a patient. I told her that my doctor was denying me treatment for a life threatening disease and refusing to release my records. This non doctor patient "advocate" then proceeds to tell me without skipping a beat and not even looking at my chart says "We dont even know if you even HAVE a tumor to begin with!" It's clear as day on both scans.

Now, it was after that phone call with the nurse about that first CT scan that something in my gut told me something was off. It was around this time my mother in law convinced to try ivermectin. I figured at this point it would hurt. So I started a protocol, if you will. I had already taken it for about 2-3 weeks by the time I made my trip for that second opinion. It was then they drew my blood to measure my CA-19 tumor marker. It was lower.

Fast forward 3 MONTHS and I have nee team set up locally coordinating care with my original second opinion. They do an updated scan expecting to see devastating results. What they saw was ZERO changes.

@FranDHexe

This tumor remained a local, yet unresectable, recurrence. No other organs or lymph nodes were affected.

They did just 6 weeks of chemo (5-FU pump) paired with small bit of radiation 5x a week. My scans after treatment as well as my tumor markers, indicate NED status, which I still am! I'm not even 40 and already faced and beat one hell of a battle!

7:27 PM · Dec 19, 2024 · 12 Views

## My Take:

To summarize this complicated story:

- 36 year old mother of 4 was diagnosed with Stage 2 Pancreatic Ductal Carcinoma (PDAC), wrapped around her blood vessels, preventing her from getting surgery.

- She did 6 months of chemo, which shrunk the tumor away from the blood vessels just enough to allow her to have surgery (Whipple procedure).
- The tumor that was removed, however, was twice the size of the original tumor indicating the Pancreatic Cancer had already overcome the effects of the chemo even before the surgery and had been growing again very quickly.
- Surgeons claimed they got it all but they didn't (post op pathology report showed positive margins but no one caught it and no one seemed to know)
- She had ongoing symptoms but wasn't taken seriously by Oncologists.
- Her cancer markers CA-19 spiked and sure enough, 8 months after surgery she was diagnosed by CT with a Pancreatic cancer recurrence, nearly the same size as the 1st tumor, but her Oncologists refused to treat her and tried to put her on a trial of some kind.
- She went to MD Anderson for a second opinion.
- This is where she starts taking Ivermectin on the advice of her mother in law "my mother in law knew of Dr.Makis and his research").
- She took Ivermectin for three months while getting a new cancer team to prepare treatment for her Pancreatic Cancer recurrence.
- During those three months the tumor STOPPED growing and was unchanged on CT and had not metastasized.
- Her 2nd Oncology team then did 6 weeks of chemo and radiation.
- She is now Cancer free!

Mama's Mead & Menageries   
@FranDHexe

Taking care of tumor 2 was much easier than tackling tumor 1. The ivermectin played a HUGE role in that!

5:21 PM · Jan 1, 2025 · 24 Views

Mama's Mead & Menageries

@FranDHexe

What I'm saying is that with my type of cancer, it doesn't just stop growing. It grows fast and takes you down quickly. That 3 months of no treatment, I should've been dead. Ivermectin stopped the cancer cells from replicating. The chemo finished clearing it out. Compared to how the first tumor growth rate and the second, for this to just suddenly stop is absurd!

6:59 AM · Dec 20, 2024 · 507 Views

## Explanation:

- How do I explain what happened here?
- During the 3 months that she was diagnosed with a LOCAL Pancreatic cancer recurrence but her Oncologists refused to treat her, the Ivermectin definitely stopped the tumor growth.
- Without the Ivermectin she would have progressed to Stage 4 with metastasis this was an aggressive cancer!
- Ivermectin stopped tumor growth and prevented the tumor from metastasizing
- But it doesn't end there.
- Furthermore, Ivermectin sensitized her cancer to the chemo and radiation that she then received "they did just 6 weeks of chemo paired with a small bit of radiation 5x a week".
  - Ivermectin kills stem cells, making it possible to reach NED post chemo and radiation ([2017 Dominguez-Gomez et al: "Ivermectin as an inhibitor of cancer stem-like cells"](#))
  - Ivermectin inhibits tumor growth and metastasis ([2020 Chen et al: "Ivermectin suppresses tumour growth and metastasis through degradation of PAK1"](#))

- Ivermectin inhibits metastasis ([2022 Jiang et al: “Ivermectin inhibits tumor metastasis by regulating the WNT/B-catenin/integrin b1/FAK signaling pathway”](#))
- Ivermectin reverses chemo drug resistance, allowing chemo to kill more cancer cells ([2019 Jiang et al: “Ivermectin reverses the drug resistance in cancer cells through EGFR/ERK/Akt/NF-kB pathway”](#))
- Ivermectin sensitizes cancer cells to radiation, allowing radiation to kill more cancer cells. ([2020 Mudassar et al: “Targeting tumor hypoxia and mitochondrial metabolism with anti-parasitic drugs to improve radiatio response”](#))
- Ivermectin WAS responsible for her excellent response to chemo and radiat and the outcome of now being CANCER FREE!

**Mama's Mead & Menageries** ✓  
@FranDHexe

Within 6 months of my jabs I was hospitalized with severe acute pancreatitis that baffled doctors but deemed a fluke. I bounced back only for it return a few months later. Within a year I had unrelenting abdominal pain, bloating, itching, and had turned yellow. I was fortunate the pancreatic cancer was caught relatively early. But the nature how this tumor and my recurring tumor grew, was extremely rapid, it's a miracle I'm a live and did manage to beat it.

Given my age and health, doctors assumed it was genetic. They full a genetic panel testing for all cancers. Absolutely nothing. I'm also being monitored for a spot on my breast. I'm not even 40.

@FranDHexe

Bc of this and having little information at the time and little time to spare, I went with a paste protocol. It was my mother in law who did all the research! I just followed what she told me bc I didn't want to die so young and with 4 kids! I have no issue sharing what I did in my desperate situation, but I really encourage folks to do their own research. Remember, I'm not a doctor!

Another example showing that we have to take more responsibility for our health. Thank God h  
mother-in-law knew about Dr. Makis and about Ivermectin.
